

Problem Statement: AI Legal Aid Multi-Agent System

The Challenge

Access to legal advice is often expensive, time-consuming, and difficult to understand. Individuals and small businesses struggle to interpret contracts, understand legal rights, and ensure compliance with regulations due to complex legal language and scattered resources. Traditional legal aid systems are limited by expert availability and lack real-time support.

The Objective

Build an AI-powered Multi-Agent Legal Aid System using IBM watsonx.ai, IBM Granite Models, LangFlow, and Retrieval-Augmented Generation (RAG) to provide accessible legal assistance.

The solution should include:

1. Legal Information Retrieval (RAG)

Retrieve and summarize relevant laws, regulations, legal documents, and case precedents.

2. Document Parsing and Analysis

Analyze contracts, policies, and legal notices to identify important clauses, obligations, risks, and inconsistencies.

3. Conversational Legal Assistant

Provide simple explanations of legal concepts through natural language interaction with a disclaimer that it is not a replacement for a lawyer.

4. Specialized Multi-Agent System

Contract Reviewer Agent:

Identifies risks and inconsistencies in legal documents.

Compliance Checker Agent:

Verifies adherence to rules and regulations.

Legal Q&A; RAG Agent:

Answers user-specific legal questions.

Case Research Agent:

Retrieves relevant judgments and case summaries.

5. User-Friendly Dashboard

Displays legal insights, recommendations, document highlights, and analysis results.

Technology Stack

IBM watsonx.ai

IBM Granite Models

LangFlow
Retrieval-Augmented Generation (RAG)
Vector Database

Expected Outcome

An intelligent AI legal assistant that improves access to legal information, simplifies legal documents, and provides reliable and explainable legal guidance.

Disclaimer:

This system provides legal information assistance and does not replace professional legal advice.
